

PERMACULTURE COURSE

A permaculture designed course is a standardized curriculum focused on ecological design, sustainability, and regenerative practices. Key modules include ethics (earth care, people care), design methodologies (zones, sectors), water management, soil health, and food forests. Course often ends with a practical design project.

Core Curriculum

- **Introduction and Ethics**
 - o History of permaculture
 - o Key problems, and
 - o The core ethics: Care for earth, people, and fair share/surplus.

Permaculture Principles

- o Exploration of Holmgren's and Mollison's principles of sustainable living.

Design Methodologies

- o Approaches to mapping
- o Analysis (sectors, zones, elevation), and
- o Observing natural patterns

Water Management

- o Harvesting, storing and managing water, understanding the water cycle

Soil Health and fertility

- o Soil structure
- o Composting, and
- o Improving soil fertility

Food Forests and Gardening

- o Designing perennial food systems
- o Companion planting, and
- o Seed saving

.

Ecological Structures

- o Building techniques and renewable energy systems

Social Permaculture

- o Community development
- o Local economies, and
- o Governance

Practical Design Project

- o Students apply learning to create a design project, often for a real –world client.

Structure

- **Duration:** Typically, a 72-hour curriculum
- **Delivery:** Can be taught over two weeks, as a series of weekends, or online
- **Focus:** Practical application of ecological principles to homes, landscapes, and communities.
