

PLUMBING

A plumbing course entails comprehensive training in installing, repairing, and maintaining water supply, drainage, and gas systems in residential and commercial buildings. Programs

combine classroom theory with hands – on workshop training on pipefitting, fixture installation, and safety protocols. Key topics include:

- o **Pipefitting and joining:** Cutting, bending, and joining materials like PVC, copper, and steel.
- o **Systems Installation:** Setting up water supply pipes, drainage networks, sewage systems, and water heating systems.
- o **Fixture Installation:** Installing toilets, sinks, faucets, showers, and water tanks.
- o **Maintenance and repair:** Diagnosing leaks, clearing blockages, and servicing fixtures.
- o **Technical skills:** Reading blue prints, site management, and safety protocols (health and safety standards).

Most courses provide hands on experience, often preparing learners for certification examinations (e.g. KNEC, NITA) in 9 months to 2 years.
