

HORTICULTURE

A horticulture course covers plant propagation, cultivation techniques, garden design, and post-harvest management, designed to equip students with skills in fruit, vegetable, and ornamental plant production. Typical curricula include botany basics, greenhouse management, and hands-on training for roles in agricultural research, management, or design.

Core Horticulture Course Modules Plant Science Fundamentals

- o Botany
- o Basics
- o Plant
- o Anatomy
- o Soil health
- o Plant nutrition, and
- o Growth physiology

• Plant Propagation

- o Techniques for sexual (seeds) and asexual (grafting, cuttings, layering) plant propagation.

• Crop Management

- o Commercial production of fruits (Pomology)
- o Vegetables (Olericulture), and
- o Flowers (Floriculture)

• Plant Protection

- o Identification and management of plant pests, diseases, and weeds

• Landscape Technology

- o Principles of landscaping
- o Site analysis, and
- o Maintenance

• Post-Harvest Technology

- o Handling
- o Storage
- o Marketing of horticultural products to reduce losses

Common Course Structure

- **Theory and Practice:** Modules are typically split between classroom and laboratory/greenhouse work
- **Industrial Attachment:** Hands-on experience through field work in horticultural enterprises
- **Electives:** Options may include biotechnology, medicinal plant production, and agroforestry.

Career Outcomes

Graduates often work as horticultural technicians, managers for greenhouses/plantations, landscapers, or in agricultural consultancy.
